JECINTA ONYINYECHI UMEOHANA

Cloud DevOps Engineer

umehjecinta2@gmail.com • +234 701 935 8274 • Abuja, Nigeria • LinkedIn • GitHub: UmehJecinta

PROFESSIONAL SUMMARY

Detail-oriented Cloud DevOps Engineer passionate about building secure, automated, and scalable infrastructure. Skilled in Infrastructure as Code with Terraform and Ansible, containerization with Docker, and CI/CD pipeline automation with GitHub Actions, including automated health checks and rollback. Hands-on experience deploying and orchestrating applications with Kubernetes (Minikube, k3s) through self-directed projects. A fast learner who documents thoroughly and takes ownership of a problem until it is genuinely solved.

TECHNICAL SKILLS

Cloud Platforms: AWS (EC2, VPC, S3, Lambda, ALB, Auto Scaling Groups, IAM, Security Groups, NAT Gateway)

IaC & Config Management: Terraform (multi-provider), Ansible, systemd, HCL, YAML, JSON, Git/GitHub

Containers & Orchestration: Docker, Docker Compose, Kubernetes (Minikube, k3s), Traefik, Gunicorn, Nginx (Reverse Proxy & Load Balancing)

CI/CD & Automation: GitHub Actions, Docker Hub image registry, automated health checks and rollback

Application Development: Python (Flask), React, Django & Django REST Framework, RESTful APIs, JWT Authentication, PostgreSQL

Scripting & OS: Bash/Shell Scripting, Linux (Ubuntu), Automation Scripts

Architecture: Microservices, Serverless, 2-Tier/3-Tier, High Availability, Disaster Recovery, Security Best Practices (least privilege, defence in depth)

Domains & Delivery: Custom Domain & SSL/TLS (Cloudflare Origin Certificates, DNS), Static Site Hosting

Soft Skills: Cloud Architecture Design, Cost Optimization, Technical Documentation, Cross-Functional Collaboration, Continuous Learning

PROFESSIONAL EXPERIENCE

Cloud Engineer - Neocloud Technologies — 2025

- Completed a hands-on Cloud Engineering internship covering AWS fundamentals, Infrastructure as Code, and serverless architecture, alongside the NC 03 Cloud Computing certification
- Architected and deployed a fault-tolerant 2-tier AWS network with Terraform, provisioning a multi-AZ VPC, dual Application Load Balancers, and Auto Scaling Groups for high availability
- Engineered an event-driven S3 Cross-Region Replication pipeline with Lambda and Terraform for disaster recovery and data durability
- Deployed and configured static websites, Flask, and Django applications on Linux servers, setting up web servers and reverse proxies for reliable, production-style hosting

TECHNICAL PROJECTS

Project 1: AWS 2-Tier Web Application Infrastructure (Terraform) — 2025

Neocloud Technologies Project

- Architected and deployed a fault-tolerant 2-tier AWS infrastructure with Terraform, provisioning 20+ resources across a multi-AZ VPC with public/private subnets, dual Application Load Balancers, and Auto Scaling Groups (2-4 instances, 99.9% availability)
- Enforced least-privilege security groups chained tier-to-tier, and automated EC2 bootstrapping via Bash userdata, cutting deployment time by 75%
- Fixed a missing depends_on dependency on the NAT Gateway to guarantee correct resource creation order, and made a deliberate call to remove an incomplete CloudWatch setup rather than ship false confidence

Technologies: *Terraform · AWS (EC2, VPC, ALB, Auto Scaling, IAM, NAT Gateway) · Nginx · Bash*

Project 2: S3 Cross-Region Replication with Lambda (Terraform) — 2026

Self-Directed Project

- Built an event-driven, cross-region S3 replication pipeline as a disaster-recovery pattern: uploading a file to a source bucket automatically triggers a Lambda function that copies it into a second bucket in a different AWS region

- Provisioned every component as code with Terraform - two S3 buckets across two aliased AWS provider regions, an IAM role and policy scoping Lambda's permissions, the Lambda function, an explicit invoke permission, and the S3 event notification wiring the trigger together
- Tested the pipeline end-to-end by uploading a real file and confirming cross-region replication, then tore down all resources with terraform destroy, resolving a BucketNotEmpty error by emptying both buckets first

Technologies: *Terraform · AWS Lambda · Amazon S3 (Cross-Region Replication) · IAM · Python · AWS CLI*

Project 3: Django Deployment with Ansible (Bare-Metal, No Containers) 2026

Self-Directed Project

- Built an Ansible playbook that provisions a Django application onto a bare-metal Ubuntu EC2 server without containers, automating every step from package installation to a live, running app
- Installed Gunicorn and the app's dependencies into an isolated Python virtual environment to work within PEP 668's system-wide pip restriction, and pinned dependency and source versions for reproducible deploys
- Configured Gunicorn as a systemd-managed service bound to localhost only, with Nginx as the public-facing reverse proxy, and used Ansible handlers so services restart only when their configuration actually changes
- Scoped file permissions to least privilege and debugged real issues end-to-end: a private-subnet SSH routing block, a git branch-name mismatch, and repository/permissions cleanup

Technologies: *Ansible · systemd · Gunicorn · Nginx · Python (venv) · AWS EC2 · Git*

Project 4: Containerized 3-Tier Application - Docker & Kubernetes Deployment 2026

Collaborative Project (Contributor) — React / Django / PostgreSQL

- Deployed a containerized React (Vite), Django REST Framework, and PostgreSQL application to AWS EC2 using Docker Compose behind Nginx, then moved CI/CD to a Docker Hub image-registry (build-once, deploy-everywhere) pattern
- Built automated health checks with rollback, tracking a persisted “last known good” reference so failed deploys are detected and reverted without manual intervention
- Later extended the project with Kubernetes: proved the deployment out on Minikube, then deployed it on a self-managed k3s cluster on EC2, with persistent storage for PostgreSQL, Kubernetes Secrets for configuration, and Traefik handling routing and TLS termination
- Rewrote the CI/CD pipeline to build and push images, apply Kubernetes manifests, and restart deployments automatically, with rollback via kubectl rollout undo, and secured the app with a Cloudflare Origin Certificate in Full (Strict) mode

Technologies: *Docker · Kubernetes (Minikube, k3s) · Traefik · Docker Hub · AWS EC2 · Nginx · Cloudflare · GitHub Actions · React · Django REST Framework · PostgreSQL · JWT Auth*

EDUCATION

Bachelor of Science in Business Administration **Graduated: 2023**

Nnamdi Azikiwe University, Awka, Anambra State, Nigeria

Relevant Competencies: Project Management, Business Process Optimization, Data Analysis, Strategic Planning, Cross-Functional Team Collaboration

CERTIFICATIONS & CONTINUOUS LEARNING

- AWS Certified Solutions Architect - Associate (In Progress)
- NC 03 - Cloud Computing | Neocloud Technologies - September 2025
